

AIR INTAKE SYSTEM FOR OFF-ROAD VEHICLE

ABSTRACT OF THE DISCLOSURE

An off-road vehicle includes a frame and four wheels that support the frame. Two seat assemblies are disposed side by side on the frame. The seat assemblies are separated from each other to define a space therebetween. An engine powers the wheels. The engine defines an air intake port that communicates with a combustion chamber. An air intake system delivers air to the intake port. At least a portion of the air intake system extends through the space.
